| 8 | ModSelL | The ModSelL is an input pin. When held low by the host, the module responds to 2-wire serial communication commands. The ModSelL allows the use of multiple QSFP+ modules on a single 2-wire interface bus. When the ModSelL is “High”, the | |

| | | | |
|----|---------|--|--|
| | | module shall not respond to or acknowledge any 2-wire interface communication from the host. ModSelL signal input node must be biased to the "High" state in the module | |
| 9 | ResetL | The ResetL pin must be pulled to Vcc in the QSFP+ module. A low level on the ResetL pin for longer than the minimum pulse length (t_Reset_init) initiates a complete module reset, returning all user module settings to their default state. Module Reset Assert Time (t_init) starts on the rising edge after the low level on the ResetL pin is released. | |
| 10 | VccRx | + 3.3V Power Supply Receiver | |
| 11 | SCL | 2-Wire Serial Interface Clock | |
| 12 | SDA | 2-Wire Serial Interface Data | |

| 26 | GND | Ground | |
| 27 | ModPrsL | Module Present, connect to GND | |
| 28 | IntL | The IntL pin is an open collector output and must be pulled to host supply voltage on the host board. The INTL pin is de-asserted "High" after completion of reset, when byte 2 bit 0 (Data Not Ready) is read with a value of '0' and the flag field is read. | |
| 29 | VccTx | +3.3 V Power Supply transmitter | |
| 30 | Vcc1 | +3.3 V Power Supply | |

| | | | |
|----|--------|---|--|
| 31 | LPMODE | The LPMODE pin shall be pulled up to Vcc in the QSFP+ module. This function is affected by the LPMODE pin and the combination of the Power_over-ride and Power_set software control bits (Address A0h, byte 93 bits 0,1). | |
| 32 | GND | Ground | |
| 33 | Tx3p | Transmitter Non-Inverted Data Input, CML-I | |

Notes:

1. Circuit ground is internally isolated from chassis ground.
2. T_fault is an open collector/drain output.which should be pulled up with a 4.7K – 10K Ohms resistor on the host board if intended for use.Pull up voltage should be between 2.0V to Vcc+0.3V.A high output indicates a transmitter fault caused by either the tx bias current or the tx output power exceeding the preset alarm thresholds.A low output indicates normal operation.In the low state,the output is pulled to <0.8V.
3. Laser output disabled on TX Disable >2.0V or open, enabled on TX Disable<0.8V.
4. Internally pulled down per SFF-8431 Rev4.1 .
5. LOS is open collector output. Should be pulled up with 4.7k – 10kohms on host board to a voltage between 2.0V and 3.6V. Logic 0 indicates normal operation; logic 1 indicates loss of signal.
6. Internally connected
